

Aspiration Adds Additional Cleaning Capabilities

Improved Product Quality

The ability to aspirate product has been added as an option to the APEX Screener. The aspiration feature efficiently removes unwanted, light-weight particles from the product stream.

In addition to improving the product quality, the storage and handling of the product is improved with less troublesome foreign material to clog or contaminate the surrounding environment.

With aspiration applied to the product discharge, only the screened product fraction is aspirated rather than the entire incoming stream. Aspirating product that is already screened minimizes the air requirement and the amount of material collected in the filter system. The aspiration features can be built into a new machine or can be provided as a retrofit upgrade to any APEX Screener.

➤ These hoods allow air to be pulled over the falling product stream and are adjustable for various products and rates.
